

FORMS AND PROCESS DESIGNER

DYNAMIC FORMS

Dynamic Forms

The Forms and Process Designer features help your users create intelligent forms to capture lead data that's relevant to their departments, products, or processes.

Key Features of Forms

- The ability to capture lead, activity and task fields in the same form.
- Single-step and multi-step forms.
- Customizable sections, tabs, sub-forms and fields.
- Ability to configure rules to –
 - Show/hide sections/tabs/sub-forms and fields
 - Display values based on conditions and previous inputs.

You can customize forms to behave in ways specific to your use cases, and prompt users to collect the right information based on a lead's previous inputs.

Once you've created a form, the Process Designer helps you choose where, and to which users you want the form to appear. You can also use it to combine multiple forms into processes.

Manage Forms

To access the **Manage Forms** page, navigate to Workflow → Manage Forms

The screenshot shows the 'Manage Forms' interface. At the top, there's a navigation bar with tabs: DASHBOARD, CONTENT, MARKETING, LEADS, WORKFLOW (selected), APPS, and REPORTS. Below the navigation bar, the 'Manage Forms' title is displayed. A search bar labeled 'Search Forms' is present. Below the search bar, there are filter options: 'Filter by Tag' with an 'Apply Tag...' button, and dropdown menus for 'Status' (All), 'Type' (All), 'Modified By' (Any), and 'Modified On' (All Time). A table lists the forms with columns: Form Id, Name, Type, Status, Modified By, Modified On, and Actions. The table contains one entry: Form Id 'F1', Name 'Form 1', Type 'Primary', Status 'Draft', Modified By 'Vir Singh', and Modified On '10/08/18 02:23 PM'. To the right of the table, there's a '+ Create Form' button and a 'Related Settings' section with links for 'Manage Custom Fields' and 'Manage Custom Activities'. At the bottom, there's a 'Show' dropdown set to '25' and a pagination indicator '1 - 1 of 1'.

Form Id	Name	Type	Status	Modified By	Modified On	Actions
F1	Form 1	Primary	Draft	Vir Singh	10/08/18 02:23 PM	

All forms you create will appear on the grid. You can search for a form, filter by tags, and even filter based on status, type, modified by and modified on dates. The settings icon under the **Actions** column allows you to edit, delete, add tag, clone, rename or publish a form and test a published form.

Create Form

Click the Create Form button to create a new form.

The image illustrates the 'Create Form' workflow in three steps:

- Manage Forms:** The user is in the 'Manage Forms' section. A red arrow points to the 'Create Form' button in the top right corner.
- Create Form (Step 1):** The 'Create Form' pop-up is shown. The user has entered a name, selected 'Lead Fields' under 'Choose the type of fields to use', and chosen an activity from the 'Select Activity' dropdown menu. The 'Next' button is visible at the bottom right.
- Create Form (Step 2):** The 'Create Form' pop-up is shown again, now at the 'Choose the type of form' step. The 'Primary Form' option is selected, and the 'Next' button is visible at the bottom right.

On the **Create Form** pop-up –

1. First give your form a name.
2. Then choose whether you want the form to contain lead fields, activity fields or both. If you choose to include activity fields, you must select an activity type.
3. Click **Next**

Alternatively, you could click the **Create with default options** link at the bottom to create a form with only lead fields.

Note: If you want to use Custom Fields Sets (to upload documents), select the activity where the custom field set has been set up.

Choose the type of form you want to create –

- **Primary Form** – This is the main form that will appear on the Manage Forms grid. You can use the Process Designer to combine primary forms into processes.
- **Sub Form** – A sub-form can be integrated into a primary form. It will not show up on the Manage Forms grid.

Click **Next**, when you're done.

Create Form

The screenshot shows a 'Create Form' dialog box with the subtitle 'Configure your form properties'. Under the heading 'Choose the flow of form', there are two options: 'Single step form' (selected with a radio button) and 'Multi step form' (unselected). Below 'Single step form' is the description 'View all tabs upfront, save & exit at any tab'. Below 'Multi step form' is the description 'Focus on 1 tab at a time, save & exit at last'. There is also an unchecked checkbox labeled 'Save each step (Complete 1 step to proceed step 2)'. At the bottom, there is a 'Previous' button, a link 'Create with default options', and a 'Create' button.

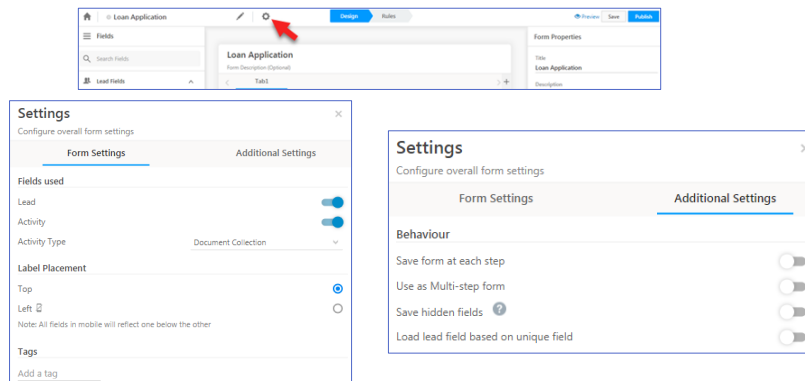

Single step form shows all the sections as tabs upfront. Multi step form allows user to fill one section before proceeding to next. Each section will be displayed as one tab at a time

Choose how you want your form to flow. Choose between –

- **Single step form** – All tabs will be visible upfront. You can switch between tabs, and save & exit while on any tab.
- **Multi step form** – Users will only see one tab at a time. You can only save and exit the form at the last step.

Then click **Create**.

Customizing Form Settings

The form editor lets you design your form, configure properties, create rules, save and finally publish to live.

To change the form name, click the edit icon alongside the form name at the top of the form editor.

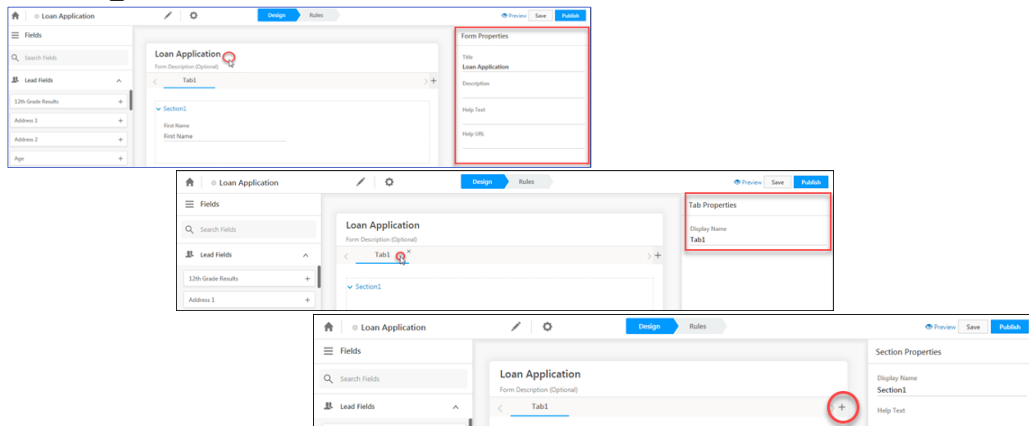

You can change some of the form properties you selected in the previous steps in the form settings menu. Click the settings icon to open the settings menu. Add/remove lead and activity fields, change the activity type, adjust the placement of the labels and add tags that you can later filter your forms by.

Click the Additional Settings tab for more options. You can –

- Set the form as single step or multistep
- Save hidden fields – When you set the value of a particular field and do not want leads to change it (for example, College Course = Bachelors of Technology), you can hide the field in your form. However, this value (e.g., Bachelors of Technology) will not get saved by default for the lead. Enabling the 'Save hidden fields' option will ensure that the field value is saved for every form submission.
- Load lead fields based on unique fields – When you enable this option and enter a phone number/email Id (or whichever field is marked unique in your account) of an existing lead, you will be prompted to auto-populate

the lead's details.

Design Form

With form design you can create and configure the tabs, sections and fields in your form.

Adjust Form Properties

1. Click the top section of your form.
2. You can adjust the form properties on the right pane. These include the form title, description help text and even a help URL you can direct users to.

Change the Tab Name

Click on a tab to change the display name using the tab properties panel on the right side of the page.

Click the Add button highlighted in screenshot to add a new tab to the form.

Form Rules

Rules let you configure the behavior of your form. You can show/hide and set values for fields based on certain conditions. You can also show/hide tabs, sections and sub-forms.

Note: You can also set conditions on multiple fields. For example, **if** 'Gender' is 'Male' and 'Age Group' is 'Adult' **then** show a 'Men's Clothing Preferences' sub-form to capture clothing preferences.

Rules – Use Cases

Capture Multiple Addresses

1. Create a field 'Is your permanent address the same as your mailing address?'
2. Create a 'Permanent Address' sub-form with fields Address 1, Address 2, City, State, Zip, Country
3. Create a rule where if the field 'Is your permanent address the same as your mailing address' is false then show 'Permanent Address' sub-form to capture the lead's permanent address.

Capture Co-Applicant information

1. Create a tab called 'Co-Applicant Information' with fields to capture the co-applicant's personal details, KYC details etc.
2. Create a field called 'Do you have a co-applicant'
3. Create a rule where if the field 'Do you have a co-applicant' is false then hide the 'Co-Applicant Information' tab.

Making fields Mandatory

1. Set up a field called 'Identification Type', with options for say, 'Passport' and 'Pan Card'
2. If 'Passport' is selected, make a 'Passport Number' field mandatory
3. If 'Pan Card' is selected, make a 'Pan Card Number' field mandatory

Setting Rules for Forms

To create a rule, click the **Rules** tab on the top menu. Then click **Add Rule**.

You can set multiple conditions and multiple action per rule by clicking the add **+** icon.

You can add multiple rules as well by clicking the **Add Rule** button. Be sure to select if you want the action to proceed if all rules are met or if any 1 rule is met

Rules – Conditions & Actions

Conditions will vary based on the data type of the field you're setting conditions on. For example –

- Number fields will give you options like 'Greater than equal to', 'Is Between' etc.
- Drop-down fields will let you choose between pre-defined options
- Text fields will give you options such as 'Contains', 'Does Not Contain' etc.

Actions will trigger when your condition(s) are met. You can trigger actions like –Show

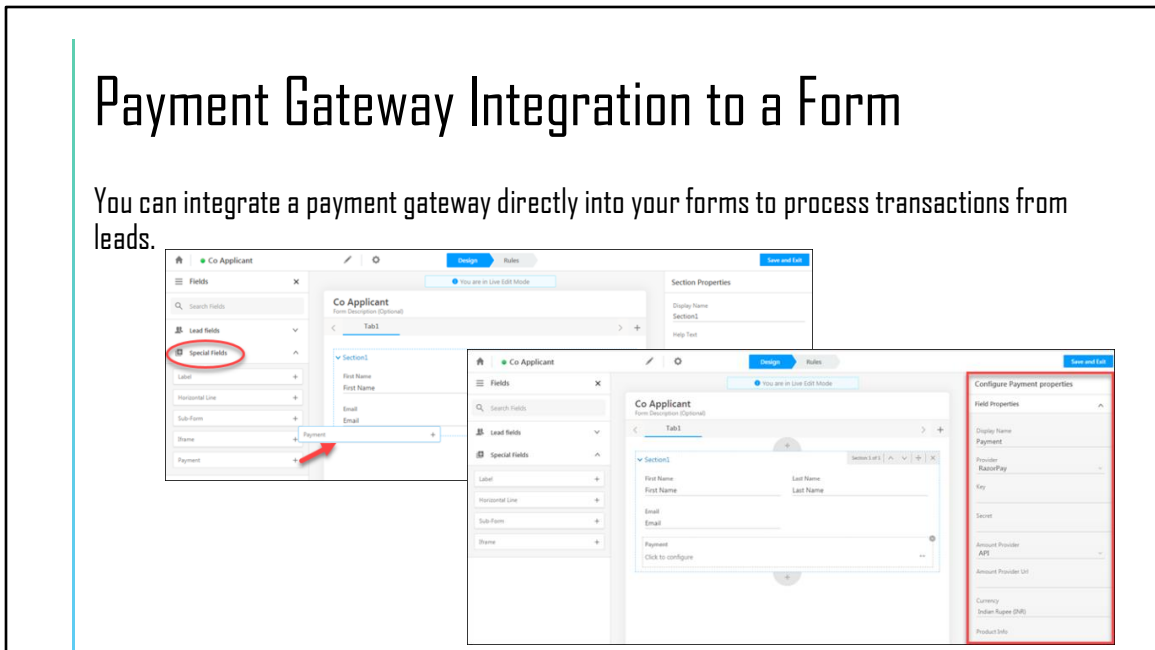

- Hide
- Set Value*
- Make Read Only
- Make Mandatory

*If you're using the action **Set Value**, you can set the value of a field –

- Through [API](#) data
- Mail Merge lead/activity fields
- Data from [Lapps](#)
- Perform calculations on numeric fields

Payment Gateway Integration to a Form

You can integrate a payment gateway directly into your forms to process transactions from leads.

We currently support the following payment gateways –

- Razorpay
- PayUMoney

While creating a form, on the left pane click **Special Fields**, then drag and drop the **Payment** field into your form.

1. Display Name: You may change the display name of the field from 'Payment' to a name of your choice.
2. Provider: The payment service provider you have an account with.
3. Key: The API keys associated with your payment provider account.
4. Secret: Secret Key of Payment API
5. Amount Provider: The payment amount can be fetched through an API or you can enter an Exact value.
6. Amount Provider URL: If you select the amount provider field as API, then you must enter the API URL here.
7. Amount: If you select the amount provider field as Exact, this option will appear. Note that you must enter the amount in the lowest currency denomination.
8. For example, for \$50.50 (fifty dollars and fifty cents), you must enter 5050

9. Currency: Choose between Indian Rupee (INR), US Dollar (USD), European Euro (EUR) and Singapore Dollar (SGD).
10. Product Info: Enter the name of the product here.
11. Required: Makes this field mandatory.
12. Hide by Default: If you enable this option, the field will only appear if there is an explicit 'Show' form rule associated with it.

Now click the Payment field in your form and enter the following field properties in the right pane.

PROCESS AUTOMATION

Process Designer

The process designer lets you organize your forms into workflows. You can create workflows for any business process such as loan/insurance application, KYC collection, education applications, medical applications, etc.

After you've created one or more forms, use the process designer to –

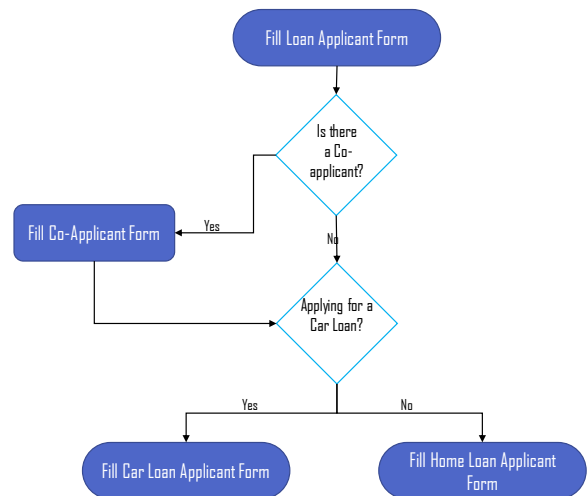

- Choose the work area (Manage Forms page, Manage Activities page, Smart Views, etc.) where you want to display your forms.
- Set conditions on users (show forms to particular teams, roles, sales groups, etc.) and form field values.
- Chain together multiple forms to create processes

Process Designer – Use Case

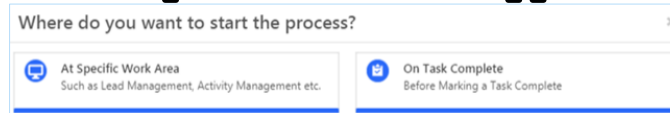

This example takes the use case of a simplified loan application process. Let's assume we've created the following forms –

- Loan Applicant form
- Co-Applicant form
- Car Loan form
- Home Loan form

Using the process designer, we can chain these forms together to create the following process –

Process Designer – Define Trigger Point

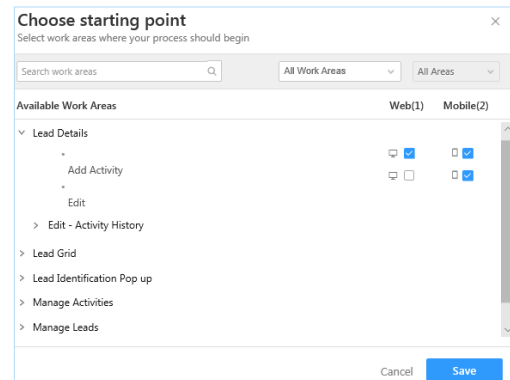

Where do you want to start the process?

☒ At Specific Work Area
Such as Lead Management, Activity Management etc.

☐ On Task Complete
Before Marking a Task Complete

At Specific Work Area

- If you select the At Specific Work Area trigger you can choose the page or area you want the process to be initiated from. You can choose multiple work areas to begin a process from.
- Under the Available Work Areas section, click on a Web and/or Mobile checkbox against the Work Area.
- Click **Save**.

Choose starting point

Select work areas where your process should begin

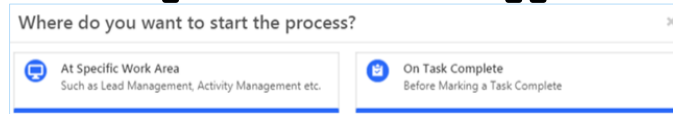

Search work areas

All Work Areas All Areas

Available Work Areas	Web(1)	Mobile(2)
Lead Details		
• Add Activity	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
• Edit	<input type="checkbox"/>	<input checked="" type="checkbox"/>
> Edit - Activity History		
> Lead Grid		
> Lead Identification Pop up		
> Manage Activities		
> Manage Leads		

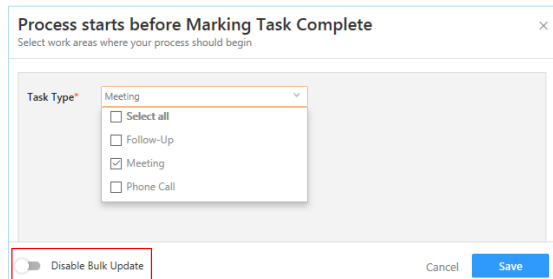

Cancel

Process Designer – Define Trigger Point

On Task Complete

- The On Task Complete trigger allows you to start the process when a user attempts to mark a task type complete.
- You must select the task types you want to initiate the process on by clicking the corresponding check-boxes.
- Click **Save** when you're done.

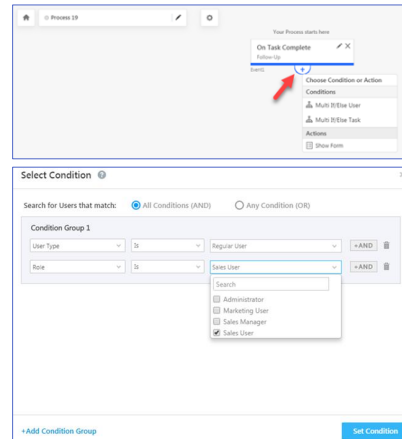

Note: When tasks are updated (completed) in bulk from the Manage Leads or Smart Views page, the process configured on a certain task type may not trigger. To ensure that users can't bulk update and complete a task type you've used as a trigger for a process, click the **Disable Bulk Update** option

Process Designer – Setting Conditions

After setting a trigger, click the add **+** icon to view the subsequent conditions and actions.

User Conditions

- You can set up multiple conditions to choose which users can see your forms and processes. You can set up these conditions on any user attribute including role, team, sales group, etc.
- Under Conditions, click the Multi If/Else User option.
- You can create condition groups and set up multiple conditions.
- Click Set Condition when you're done.

Process Designer – Setting Conditions

After setting a trigger, click the add + icon to view the subsequent conditions and actions.

User Conditions

You can set up multiple conditions to choose which users can see your forms and processes. You can set up these conditions on any user attribute including role, team, sales group, etc.

1. Under Conditions, click the Multi If/Else User option.
2. You can create condition groups and set up multiple conditions.
3. Click Set Condition when you're done.

The screenshot shows the 'On Task Complete' trigger in the Process Designer. A red arrow points to the '+' icon next to the trigger, which opens the 'Select Condition' dialog. The dialog is titled 'Select Condition' and has a search bar. Below the search bar, there are two radio buttons: 'All Conditions (AND)' (selected) and 'Any Condition (OR)'. Under 'Condition Group 1', there are two rows of conditions. The first row has 'User Type' set to 'IS' and 'Regular User'. The second row has 'Role' set to 'IS' and 'Sales User'. A dropdown menu is open for the 'Sales User' condition, showing a list of roles: Administrator, Marketing User, Sales Manager, and Sales User (selected). At the bottom of the dialog, there are two buttons: '+Add Condition Group' and 'Set Condition'.

Process Designer – Setting Conditions

The process will branch out into a Yes path and a No path.

Click the add icon under each path to continue the process.

Process Designer – Action (Show Form)

Click the Show Form action to display a published form at any point in your process.

The Show Form pop-up has 2 tabs.

The **Form Details** tab lets you choose the form you want to display, how you want the initiate process button to look in the work areas you selected and how you want the action buttons within the form to appear.

The **Events** tab lets you call Lapps or an external API before a form is submitted. You can use this as a final validation for a form submission.

The top screenshot shows the 'Form Details' tab of the 'Show Form' pop-up. It includes a 'Select Form*' dropdown with a search icon, a 'Display Text*' text input, an 'Action Buttons' section with a 'Save Button' toggle and a 'Display Text*' text input, and a 'Save and Add New Button' section with a 'Save and Add New' button and a 'Display Text*' text input. The bottom screenshot shows the 'Events' tab of the 'Show Form' pop-up. It includes a 'Pre Submission' section with a 'Type' dropdown and an 'API URL' text input, a 'Content Type' dropdown set to 'application/json', and a 'Custom Headers' section. A 'Notes' section at the bottom contains the following text: 'Details of Form Id, ProcessDesigner Id, User Id, Lead Id, Activity Id will be posted in query string parameters and Form details in Post data', 'Response other than 200 considered as failed and hence form will not be submitted. Lapp must send "IsSuccess" response parameter to know its result', and 'If there exist error - Error message must be send in response parameter "ErrorMessage"'. The bottom screenshot also shows a 'Save' button.

The API or Lapp should return 200 OK as the response code and content like `{"IsSuccess":true}` or `{"IsSuccess":false,"ErrorMessage":"Your personal details and passport details do not match. Please check"}`

After selecting a form and setting all the configurations, click **Save**. Here's an example of how the initiate process or open form button will appear

Please Complete Exercises

Open the Step-by-Step Exercise document from
